Question No: 6

- i) Given 64-bit output of (i-1)th round of DES, 48-bit ith round key K_i and E table, find the 48-bit input for S-box.
- ii) Given 48-bit input to S-box and permutation table P, find the 32-bit output R_i of i^{th} round of DES algorithm.
- i) **Algorithm:** Follow the flow-chart and tables given below.

Figure: Generation of 48-bit input for S-box.

Table: Expansion Permutation

ii) Algorithm: The outer two bits of each group select one of four possible substitutions (one row of an S-box). Then a 4-bit output value is substituted for the particular 4-bit input (the middle four input bits). The 32-bit output from the eight S-boxes is then permuted, so that on the next round, the output from each S-box immediately affects as many others as possible.

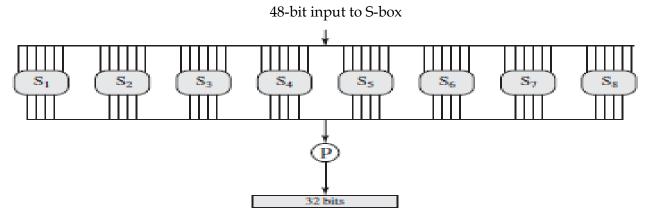

Figure: The 32-bit output R_i of ith round, given 48-bit input
